# Introduction

# 1.1 Purpose

This document describes the plans for testing the integration of the created components. The purpose of this document is to test the interfaces between the components as described in Design Document. Every team member who cooperates in the integration tests should read this document.

# 1.2 Scope

This document represents the Integration Testing Plan Document for TrackMe Service.

Integration testing is a key activity to guarantee that all the different subsystems composing Data4Help and AutomatedSOS interoperate consistently with the requirements they are supposed to fulfil and without exhibiting unexpected behaviours. The purpose of this document is to outline, in a clear and comprehensive way, the main aspects concerning the organization of the integration testing activity for all the components that make up the system.

More precisely, the document presents:

- A list of the subsystems and their subcomponents involved in the integration activity that will have to be tested
- The criteria that must be met by the project status before integration testing of the outlined elements may begin
- A description of the integration testing approach and the rationale behind it
- The sequence in which components and subsystems will be integrated
- A description of the planned testing activities for each integration step, including their input data and the expected output
- Some performance measures that should be performed on the components to check they are fulfilling the requirements

• A list of all the tools that will have to be employed during the testing activities, together with a description of the operational environment in which the tests will be executed

.

# Implemented Requirements

This section of the Implementation Plan describes function-specific implementation requirements and procedures.

# 2.1 Data4Help

# 2.1.1 Data4Help Requirements

This subsection of the Implementation Plan defines the requirements that must be met for the orderly implementation of the system and describes the hardware, software, and functional requirements for this site, in reference to already stated in the RASD. Since, regarding the implementation of Data4Help system, the requirements addressed are:

- [R1] The system must allow an individual to register a new account **D4H::Signup**
- [R2] The system must allow an individual to access to their account **D4H::Login**
- [R3] The system must allow an individual to accept or reject their requests of accessing personal data

D4H::Request

[R4] The system must be able to communicate with TrackMe database in order to obtain the health status and location of an individual

D4H::SearchManager

- [R5] The system must allow a third party company to register a new account **D4H::Signup**
- [R6] The system must allow a third party company to access to its account **D4H::Login**

[R7] The system must be able to notify the individual that a third party company wants to access its data

D4H::Request

[R8] The system must allow a third party company to search for an individual health status and location using his/her SSN

D4H::SearchManager

[R9] The system must allow a third party company to filter data of an anonymized group of individuals by country, age, gender and blood type parameters

D4H::SearchManager

[R10] The system must be able to anonymize the data of a group of individuals

D4H::APIManager

[R11] The system must allow a third party company to subscribe to an individual health status and location

D4H::Subscription

[R12] The system must allow a third party company to subscribe to data of an anonymized group of individuals

D4H::Subscription

# 2.1.2 Data4Help Implementation details

This subsection of the Implementation Plan addresses the specifics of the implementation for this site. Include a description of the implementation procedures, database and data updates. Implemented procedures are as follows:

- Procedures:
  - Login:
    - \* LoginResponse login(Spark.Request req, Spark.Response response);
    - \* void logout(Spark.Request req, Spark.Response response);
  - Signup:
    - \* SignupResponse signupIndividual(Spark.Request req, Spark.Response res);
    - \* SignupResponse signupThirdParty(Spark.Request req, Spark.Response res);
  - Search:
    - \* IndividualSearchResponse searchIndividual(Spark.Request req, Spark.Response res);

- \* BulkSearchResponse searchBulk(Spark.Request req, Spark.Response res);
- Request:
  - \* RequestResponse createRequest(Spark.Request req, Spark.Response res);
  - \* RequestResponse acceptRequest(Spark.Request req, Spark.Response res);
  - \* void rejectRequest(Spark.Request req, Spark.Response res);
  - \* Collection;Request; getAllRequests(Spark.Request req, Spark.Response res);
  - \* void removeRequest(Spark.Request req, Spark.Response res)
- Subscription:
  - \* SubscriptionResponse createSubscription(Spark.Request req, Spark.Response res);
  - \* Collection < Subscription > getAllSubscriptions (Spark.Request req, Spark.Response res);
  - \* void removeSubscription(Spark.Request req, Spark.Response res);
- Database:
  - DBHandler Morphia.Datastore getDatastore();

# 2.2 AutomatedSOS

# 2.2.1 AutomatedSOS Requirements

Regarding the implementation of AutomatedSOS system, the requirements that are addressed as below:

[R13] The system must be able to send a request for monitoring an individual's data when he/she is older than 60 years old

#### ASOS::DataHandler

[R14] The system must be able to monitor, and compare against defined thresholds, the health status of an individual

#### ASOS::DataHandler

[R15] The system must be able to contact the health-care service associated to an individual ASOS::HealthCareConnector

# 2.2.2 AutomatedSOS Implementation details

This subsection of the Implementation Plan addresses the specifics of the implementation for this subsection. Include a description of the implementation procedures, database and data updates. Implemented procedures are as follows:

- Procedures:
  - Threshold value:
    - \* Collection<Threshold> getAll()
    - \* Boolean isOutOfRange(Threshold threshold, Data data);
  - Health Care connector:
    - \* void notifyHealthcareService(String userId, Data data);
- Data Handler:
  - void getIndividualData(Spark.Request req, Spark.Response res);
  - void getRequestNotification(Spark.Request req, Spark.Response res);
- Database:
  - DBManager Morphia.Datastore getDatastore()

# 2.3 Risks and Contingencies

This subsection of the Implementation Plan identifies the risks and specific actions to be taken in the event the implementation fails or needs to be altered at any point and includes the factors to be used for making the decision. The possible risk that we are addressing in our system at this point of time are as follows:

- System fails to connect to the Server/Database, and in case of out-of-range health parameters, action cannot be taken within time.
- In these kind of scenarios, as soon as the system is back on-line, latest parameters are checked and further transmitted.

# 2.4 Acceptance Criteria

This section of the Implementation Plan establishes the exit or acceptance criteria for transitioning the system into production. Identify the criteria that will be used to determine the acceptability of the deliverables as well as any required technical processes, methods, tools, and/ or performance benchmarks required for product acceptance.

When the system passes all the test cases and end-2-end scenarios (illustrated in chapter-6 in detail) without fail and the system is 100% on-line with all the requirements stated about are implemented and working properly and making the system stable. Based on which a go/no-go decision can be taken, firstly a beta-version of the product can be published.

# **Integration Strategy**

# 5.1 Entry Criteria

In order for the integration testing to be possible and to produce meaningful results, there are a number of conditions on the progress of the project that have to be met.

First of all, the Requirements Analysis and Specification Document and the Design Document must have been fully written. This is a required step in order to have a complete picture of the interactions between the different components of the system and of the functionalities they offer.

Secondly, the integration process should start only when the estimated percentage of completion of every component with respect to its functionalities is:

- 100% for the Data4HelpWebService component
- At least 90% for the LoginService and RegisterService subsystem
- At least 70% for the SearchManager and RequestService subsystem
- At least 50% for the ASOSService applications

It should be noted that these percentages refer to the status of the project at the beginning of the integration testing phase and they do not represent the minimum completion percentage necessary to consider a component for integration, which must be at least 90%. The choice of having different completion percentages for the different components has been made to reflect their order of integration and to take into account the required time to fully perform integration testing.

# 5.2 Elements to be integrated

In the following paragraph we're going to provide a list of all the components that need to be integrated together.

As specified in TrackMe Design Document, the system is built upon the interactions of many high-level components, each one implementing a specific set of functionalities. For the sake of modularity, each subsystem is further obtained by the combination of several lower-level components. Because of this software architecture, the integration phase will

involve the integration of components at two different levels of abstraction.

At the lowest level, we'll integrate together those components that depend strongly on one another to offer the higher level functionalities of **Data4HelpWebService**. In our specific case, this involves the integration of the **Login Service and Signup Service**, **Search Management**, **Request Management**, **Subscription and Notification Management** subcomponents in order to obtain the **Data4Help Management System** subsystem.

For what concerns the building of the **AutomatedSOS** and **Track4Run** subsystems, the integration activity is actually quite limited; in fact, they simply represent a collection of functionalities belonging to the same area which however are not dependent on one another. As a result of this, their subcomponents don't really interact with each other, and the integration phase will be limited to the task of ensuring that the set of functionalities of each subcomponent is properly exposed by the subsystem. The components involved in this phase are:

- The Data Handler, Health Care Connector and DB Manger subcomponents in order to obtain the AutomatedSOS subsystem.
- The Login, Signup, User, Event, Notification, Data handler, Request and Authentication manager subcomponents in order to obtain the Track4Run Management subsystem.

Some of these subcomponents also directly rely on higher level, atomic components: that is the case, for instance, of the dependency on the **Data Handler component**. These dependencies will be taken care of in the integration process.

Finally, we will proceed with the integration of the higher level subsystems. In particular, the integration activity will involve:

- The already existing components used to achieve specific functionalities: these are the **Health Care Service**, **DBMS and Notification system** components.
- Those components and subsystems specifically developed for TrackMeService, that are:
  - On the server side: the **Data4Help Management System**, **Authentication** system, **Search subsystems**, together with the **Data Handler** component.
  - On the client side: the Data4Help Web Application and Track4Run
     Web Application components.

# 5.3 Integration testing strategy

As already explained in the Design document, let's discuss here Integration strategy in more detail. The approach we're going to use to perform integration testing is based on a mixture of the bottom-up and critical-module-first integration strategies.

Using the bottom-up approach, we will start integrating together those components that do not depend on other components to function, or that only depend on already developed components. This strategy brings a number of important advantages. First, it allows us to perform integration tests on "real" components that are almost fully developed and thus obtain more precise indications about how the system may react and fail in real world usage with respect to a top-down approach. Secondly, working bottom-up enables us to more closely follow the development process, which in our case is also proceeding using the bottom-up approach; by doing this we can start performing integration testing earlier in the development process as soon as the required components have been developed in order to maximize parallelism and efficiency.

Since subsystems are fairly independent from one another, the order in which they're integrated together to obtain the full system follows the critical-module-first approach. This strategy allows us to concentrate our testing efforts on the riskiest components first, that is those that represent the core functionalities of the whole system and whose malfunctioning could pose a very serious threat to the correct implementation of the entire TrackMe infrastructure. By proceeding this way, we are able to discover bugs earlier in the integration progress and take the necessary measures to correct them on time.

It should be noted that **Health Care Service**, **Notification System and DBMS** are commercial components that have already been developed and can thus be immediately used in a bottom-up approach without any explicit dependency.

# 5.4 Sequence of Component/Function Integration

This section describes the order of integration (and integration testing) of the various components and subsystems of TrackMe Service. This section has already been explained in detail in the **DD** - Design Document (**Reference section: 5.3.3 Integration order**).

# Individual Steps and Test Description

In this chapter we'll provide a detailed description of the tests to be performed on each pair of components that have to be integrated. Each pair of components is described in a specific subsection, identified by the <caller; called > notation, containing the list of methods that the <caller > component invokes on the <called > component. For each method we're going to provide a brief description of the input values and the corresponding expected effects on the system.

# 6.1 Data4Help Management System

# 6.1.1 Request Management and DBHandler

| Insert Request               |  |
|------------------------------|--|
| Input                        | Effect   |
| A NULL parameter             | A NullArgumentException is raised.               |
| A request with an id already | An InvalidArgumentValueException is raised.      |
| existent in the database     |  |
| Formally valid arguments     | An entry containing the request data is inserted |
|                              | into the database.                               |

#### Delete Request

| Input                            | Effect   |
|----------------------------------|--|
| A NULL parameter                 | A NullArgumentException is raised.               |
| A request with an in-existent id | An InvalidArgumentValueException is raised.      |
| Formally valid arguments         | The entry containing the request data is deleted |
|                                  | from the database.                               |

Table 6.1: Request Management parameters

Formally valid arguments

# 6.1.2 Search Management and DBHandler

| ${f Subscribe/Get\ Data}$          |   |  |
|------------------------------------|---|--|
| Input                              | Effect                                      |  |
| A NULL parameter                   | A NullArgumentException is raised.          |  |
| A search with an id in-existent in | An InvalidArgumentValueException is raised. |  |
| the database                       |   |  |

#### Unsubscribe Data

The list of all valid data based on the search id.

| Input                           | Effect  |
|---------------------------------|---|
| A NULL parameter                | A NullArgumentException is raised.              |
| A search with an in-existent id | An InvalidArgumentValueException is raised.     |
| Formally valid arguments        | The entry containing the search data is deleted |
|                                 | from the requester's view.                      |

|---|---|--|--|
| Input   | Effect  |  |  |
| A NULL parameter                                    | A NullArgumentException is raised.                  |  |  |
| A userId not correctly formatted                    | An InvalidArgumentFormatException is raised.        |  |  |
| A userDetails whose contact                         | An InvalidContactException is raised.               |  |  |
| details are invalid                                 |   |  |  |
| Vital Signs out of range                            | An AlarmRequest is raised and contact is sent to    |  |  |
|   | HealthCareService (external component) within 5     |  |  |
|   | seconds.  |  |  |
| Vital Signs in range                                | Overwrite the old data with the latest update until |  |  |
|   | the next data fetch.                                |  |  |

Table 6.8: Data4Help, ASOS integration Management parameters

# Required Program Stubs and Test Data

# 7.1 Program Stubs and Drivers

As we have mentioned in the Integration Testing Strategy section of this document, we are going to adopt a bottom-up approach to component integration and testing.

Because of this choice, we are going to need a number of drivers to actually perform the necessary method invocations on the components to be tested; this will be mainly accomplished in conjunction with the JUnit framework.

Here follows a list of all the drivers that will be developed as part of the integration testing phase, together with their specific role:

- Data Access Driver: this testing module will invoke the methods exposed by the DB Handler component in order to test its interaction with the DB Manager.
- Request Management Driver: this testing module will invoke the methods exposed by the Request Management subcomponent, including those with package level visibility, in order to test its interaction with the DB Handler, Notification System and the Subscription Management components.
- Search Management Driver: this testing module will invoke the methods exposed by the Subscription Management subcomponent in order to test its interaction with the DB Handler, Notification System and the Request Management components.
- Login Management Driver: this testing module will invoke the methods exposed by the Login Management subcomponent in order to test its interaction with the DB Handler and the token System components.
- Health Care Connector Driver: this testing module will invoke the methods exposed by the Health Care Connector Management subcomponent in order

to test its interaction with the DB Handler and the Health Care Service - external System components.

- Notification Management Driver: this testing module will invoke the methods
  exposed by the Notification Management subcomponent in order to test its
  interaction with the DB Handler, Request system and Search system components.
- Subscription Management Driver: this testing module will invoke the methods exposed by the Subscription Management subcomponent in order to test its interaction with the DB Handler and Search system components.
- Account Management Driver: this testing module will invoke the methods exposed by the Check Token Management subcomponent in order to test its interaction with the DB Handler, Login system and Signup system components.

While the bottom-up approach in general doesn't require the usage of any stubs as the system is developed from the ground up, a full test of the core system isn't possible without introducing a few of them. In fact, there is a mutual dependency between the clients (which send requests) and the core system (which replies to them). Since we are developing and integrating the system from the core, we are going to introduce stubs to simulate the presence of clients until they are fully developed. In practice, the only purpose of these stubs is to write on a log that they have correctly received the messages.

### 7.2 Test Data

In order to be able to perform the record of tests that we have specified, we are going to need:

- A list of both valid and invalid individual or third party users to test the Signup Management component. The set should contain instances exhibiting the following problems:
  - Null object
  - Null fields
  - Invalid data in one or more fields
  - Tax certificate not compliant with the legal format
  - Valid data in all fields
- A list of both valid and invalid individual or third party users to test the Login Management component. The set should contain instances exhibiting the following problems:

- Null object
- Null fields
- Invalid data in one or more fields
- valid data but system down
- Valid data in all fields
- A list of both valid and invalid requests to test the **Request Management** component. The set should contain instances exhibiting the following problems:
  - Null object
  - Null fields
  - Invalid data in one or more fields
  - valid data but incorrect format
  - Valid data in all fields
- A list of both valid and invalid searches to test the **Search Management** component. The set should contain instances exhibiting the following problems:
  - Null object
  - Null fields
  - Invalid data in search
  - valid data but does not exist in DB
  - Valid data
- A list of both valid and invalid searches to test the **Subscription Management** component. The set should contain instances exhibiting the following problems:
  - Null object
  - Null fields
  - valid data but does not exist in DB
  - Valid data
- A list of both valid and invalid notifications to test the **Notification Management** component. The set should contain instances exhibiting the following problems:
  - Null object
  - Null fields

- valid data but does not exist in DB
- Valid data
- A list of both valid and invalid notifications to test the **Health Care Service**Management component. The set should contain instances exhibiting the following problems:
  - Null object
  - Inconsistent data against threshold
  - Consistent data against threshold
  - Valid data

More specific information about the required test data can be found by analysing the inputs of all the test cases described in chapter 3.

# 7.3 Test Scenario

Scenario testing is a software testing activity that uses scenarios: hypothetical stories to help the tester work through a complex problem or test system. The ideal scenario test is a credible, complex, compelling or motivating story the outcome of which is easy to evaluate. The following high-level set of scenarios were considered for **Data4Help** system:

#### Scenario List (Data4Help Module)

| SC01 | Validate the login functionality of the system                                  |
|------|---|
| SC02 | Validate the login functionality of the system with blank data                  |
| SC03 | Validate if third party is able to request individual's data                    |
| SC04 | Validate if third party is able to request bulk data                            |
| SC05 | Validate the individual's response to request (Accept/Reject)                   |
| SC06 | Validate third party is able to search for the subscribed data on its dashboard |
| SC07 | Validate Individual is able to view for the subscribers data on its dashboard   |

Table 7.1: Test Scenario List

# 7.4 Test Cases

A test case is a specification of the inputs, execution conditions, testing procedure, and expected results that define a single test to be executed to achieve a particular software

testing objective. We will define a number of test cases against the test scenarios above stated to cover the Data4Help complete system. The following test cases are considered against the test scenarios:

# • Login Positive Test Case

| Test Scenario ID      | Login-1              | Test Case ID   | Login-1A |
|-----------------------|----------------------|----------------|----------|
| Test Case Description | Login-Positive       | Test Priority  | High     |
| Pre-Requisite         | A valid user account | Post-Requisite | NA       |

## Test Execution Steps:

| S. No. | Action  | Input                                     | Expected Output   | Actual<br>Output  | Test<br>Result |
|--------|---|---|---|---|----------------|
| 1      | Launch<br>Application                               | /login.html                               | Login Page  | Login Page  | Pass           |
| 2      | Enter Correct Email & Password and hit Login button | Email ID: test@xyz.com; Password: ******* | Login Success; User-id and access-token validated during authentication | Login Success; User-id and access-token validated during authentication | Pass           |

Table 7.2: Test Case: Login-1A

# • Login-Negative Test Case

| Test Scenar | rio ID  | Login-1                                      | Test Case ID  |   | Login-1B       |
|-------------|---|--|---|---|----------------|
| Test Case l | Description   | Login-Negative                               | Test Priority                                       |   | High           |
| Pre-Requis  | ite   | NA   | Post-Requisit                                       | e   | NA             |
| Test Execu  | tion Steps:   |  |   |   |                |
| S. No.      | Action  | Input  | Expected Output                                     | Actual<br>Output                                    | Test<br>Result |
| 1           | Launch<br>Application                                   | /login.html                                  | Login Page  | Login Page  | Pass           |
| 2           | Enter invalid Email & any Password and hit Login button | Email ID: invalid@xyz.com; Password: ******* | Error: "The provided email or password are invalid" | Error: "The provided email or password are invalid" | Pass           |
| 3           | Enter valid Email & any Password and hit Login button   | Email ID: valid@xyz.com; Password: *******   | Error: "The provided email or password are invalid" | Error: "The provided email or password are invalid" | Pass           |

Table 7.14: Test Case: Search-2B

# Installation instructions

The TrackMe project is composed by 3 different systems: Data4Help, AutomatedSOS, and Track4Run. We decided to develop Data4Help, which is the leading system, and AutomatedSOS.

# 8.1 How to run both systems?

The whole system is dockerized, just run the follow the following steps:

- 1. Install **Docker** and **Docker** Compose.
- 2. At the level of *TrackMe/src* folder, open a terminal and execute **sudo docker-compose up** (with -build to rebuild the image).
- 3. Open the browser and you can access to the Data4Help site using the following URL http://0.0.0.0:4200

# 8.1.1 How to run the tests image?

- 1. After installing *Docker* and *Docker compose* and in the src folder, execute in a terminal: sudo docker-compose -f ———;.s
- 2. This will run all the unit test cases and will exit. If the exit code is 0 and you see Tests run: XX, Failures: 0, Errors: 0, Skipped: 0, everything is ok.

# 8.2 How to each system independently?

## 8.2.1 How to work on the back-end?

The following are the steps needed to work on the back-end:

- 1. You will need JDK >= 8.
- 2. Install Apache Maven.
- 3. Install MongoDB and Redis.

- 4. In the folder TrackMe/src/data4help/, open a terminal and run mvn compile.
- 5. [Optional] To run the service:
  - (a) Make sure that MongoDB and Redis services are running.
  - (b) Execute the following line:
     mvn -X compile exec:java -Dexec.mainClass=avila.schiatti.virdi.Main
     -e.
  - (c) You will be able to access the site/services by accessing to  ${\rm http://127.1.1.1:4567}$

In order to be able to have the front end, you should follow the steps of the front-end section, without running it

#### 8.2.2 How to work on the front-end?

In order to work on the front-end, follow this steps:

- 1. Install Nodejs and NPM.
- 2. Install AngularCLI by running the following line: npm install -g @angular/cli
- 3. Go to src/main/resources folder and install the package dependencies running: npm install
- 4. Build the project by running **ng build**.
- 5. To run the front-end, you can run: **ng serve**. You will be able to access the front-end by accessing to **http://127.1.1.1:4200**

You won't have access to the back-end services, so probably the front-end alone is not useful)

# Effort spent

| Team Work            |       |  |  |  |
